Tutorial: Part 1

Setup Device for Android Development

Created by: Steven King

Assistant Professor of Interactive Media

UNC School of Journalism and Mass Communication

TUTORIAL PLAN

Objective

Learn how to setup personal Android device to use for development.

Goals

Get through this a painless and possible!

Time

Less than 5 mins

Outline

1. Enabling Device for Development

1. ENABLING YOUR DEVICE FOR DEVILMENT

Android takes a much simpler approach to running development applications. No keys or profiles are necessary as with iOS. Because there are so many different hardware makers and versions of Android the exact steps might be different but the concepts are all the same.

Go to Settings Application —> Security

Look for a way to enable apps from Unknown Sources. It should look something like the screen below.

Enable the Unknown Sources Setting.

That is all! Yes, that's it!

You can now run development apps on you android device.
